Part I Talk Notes

1.1 Lecture 1

1.1.1 Lecture Name

We start with the famous theorem of Kronecker-Weber Theorem.

Theorem 1.1. If K/\mathbb{Q} is an abelian Galois extension, then $K = \mathbb{Q}(\zeta_n)$ for some n, where ζ_n is a (primitive) nth root of unity.

Kronecker's famous JugendTraub. Want to construct? Using the roots of unity. to make abelian Galois extensions.

Lubin-Tate: Get Galois extensions using formal groups. Formal group law over R. F(x,y) = $x +_F y = x + y + \cdots$

$$x +_F 0 = 0 +_F x = x +_F y = y +_F x (x +_F y) +_F z = x +_F (y +_F z)$$

Lie variety over R Objects \mathbb{A}^n , $n=0,1,\ldots$ maps $\mathbb{A}^n\to\mathbb{A}^1$, $f(x_1,\ldots,x_n)\in R[x_1,\ldots,x_n]$ $\mathbb{A}^n = A^n \to \prod \mathbb{A}^1$

Question: How many formal group laws are there? How to construct formal group laws?

Theorem 1.2 (Lazard). $R \mapsto \text{formal group laws over } R, \text{ring}(L, R), L = \mathbb{Z}[x_1, x_2, \ldots].$

Isomorphism $F \stackrel{g}{\longrightarrow} G g(x) g(x +_F y) = g(x) +_F g(y)$

Universal isomorphism over $L[s_1, s_2, ...]$

Algebraic Topology

Cohomology theories E with Chern classes in complex line bunles, $V/X \to c_i(X) \in E^{2n}(X)$ $c_n(V\mathbb{C})_N = \sum_{i+j=n} c_i(Y)c_j(W)$ Not true in general $c_1(L_1 \otimes L_2) = c_1(L_1)$

Theorem 1.3 (Quillen). For general, E, there exists a formal group law $F c_1(L_1 \otimes L_2) = F(c_1(L_1), c_1(L_2)) =$ $c_1(L_1) +_F c_1(L_2)$

$$H^s(\mathfrak{m}_{FG},\omega^*)\Rightarrow \pi_{2t-s}S^0=\lim_{n\to\infty}\pi_{2t-s+n}S^n\;\omega=\operatorname{Lie} F^*$$

Example 1.1.
$$G_n x + y G_m x + y - xy = 1 - (1 - x)(1 - y)$$

Are these isomorphic?

 $g(x) = 1 - e^{-x} g(x + y)$ maybe= g(x)g(x) - g(x)g(y) over Q-algebra So isomorphic over rationals.

Are they isomorphic over \mathbb{F}_{v} ? Are there even homomorphisms between them? Suppose g: $G_n \to G_m$ is one such $g(x + \cdots + x) = 1 - (1 - g(x))^p$ $0 = g(0) = g(x)^4 = g^0(x^p)$ so that g = 0 so no homomorphisms from additive group to multiplicative group.

Height:

R = k field of char p > 0 $f : G_1 \rightarrow G_2$ Then there exists unique g(x), $g'(0) \neq 0$, $y = p^a$ $f(x) = g(x^q)$ a is the height of f. Height of a formal group is by definition the height of mult by p height $G_n = \infty$ height $G_m = 1$

Theorem 1.4 (Dieudonne). k perfect algebraically closed, any two formal groups of the same height are isomorphic.

Lubin-Tate deformation spaces Γ , k field char p > 0, B complete local \mathfrak{m} -maximal local

A deformation of
$$\Gamma$$
 to $B B \xrightarrow{r} B/\mathfrak{m} \stackrel{\iota}{\leftarrow} k$

$$(G, i, f), G \xrightarrow{f} i^*\Gamma \operatorname{Deform}_{\Gamma}(B) \leftarrow \operatorname{groupoid}$$

Theorem 1.5 (L-T). $n = height \ of \ \Gamma \ \pi_0 \ Deform_{\Gamma}(B) = \mathfrak{m}^{n-1}$

We want to understand this set \mathfrak{m}^{n-1} mod by automorphisms of Γ .

 G_{univ} universal deformation $W[[u_1, \dots, u_{n-1}]]$ W witt vectors of k Universal deformation $E_0 = W[[u_1 - u_{n-1}]]$ $E_* = W[[U_1 - u_{n-1}]][u, u^{-1}], |u| = -2$

Aut $\Gamma = S_n$, acts on E_* $UE_0 = E_{-2}$ sections of Lie G interested in $H^*(S_n; E_0)$, not the symmetric group $H^*(S_n; E_{2n})$

Question: Can one write down explicitly the action of Aut Γ on $W[[u_1 - u_{n-1}]]$.

Question: What is Pic(Lubin tate) = $H^1(\operatorname{Aut}\Gamma; E_0^*)$, conjectured answer enlists known n=2, p>5

Observation: n=2, $H^*(S_n;W)\stackrel{\sim}{\longrightarrow} H^*(S_n;E_0)$ p>3 Shimomura $p\leq 3$ Beaudiy, Bobkova, Behrens, Wenn, . . . True for n>2?

Ex:
$$G_m$$
, $x + y - xy = 1 - (1 - x)(1 - y)$ over \mathbb{Z}_p Aut $G_m = \mathbb{Z}_p^\times \lambda \in \mathbb{Z}_p^\times x \mapsto 1 - (1 - x)^\lambda$ Lubin-Tate ring \mathbb{Z}_p Aut G_m acts trivially. $E_0 = W[[u_1, \dots, u_{n-1}]] E_s = W[[u_1 \dots u_{n+1}[u^{\pm 1}], |u| = -2$ $\mathbb{Z}_p[u^{1/2}] \lambda \in \operatorname{Aut}(G_m) = \mathbb{Z}_p^\times \operatorname{How} \operatorname{does} \lambda \operatorname{act} \operatorname{on} u$? u^{-1} is an invariant differential on $G_m u^{-1}$ is $dx + \dots = (1 - x) dx$ $1 - (1 - x)^\lambda = \lambda x + \operatorname{hot} u^{-1} \mapsto \lambda u^{-1}$. $H^*(\mathbb{Z}_p^\times) = \mathbb{Z}_p[u^{\pm 1}], p > 2 \lambda^{-1} \in \mathbb{Z}_p^\times \lambda^{-1} \operatorname{generates} \mathbb{Z}_p^\times \operatorname{map} (\lambda^{-1})^{p-1} \neq 1 \operatorname{mod} p^2$ $H^1(\mathbb{Z}_p^\times) = \mathbb{Z}_p/(\lambda^n - 1) n \neq 0$ Makes sense for $\lambda \mapsto \lambda^n$ Replace by $\operatorname{Hom}(\mathbb{Z}_p^\times, \mathbb{Z}_p^\times)$ $n = 2 \Gamma$ is formal group over k of height $2 H^*(\operatorname{Aut}\Gamma; W[[u_1]]) = ?$ It turns out, $p > 3 \Lambda[x_1, x_3] = H^*(\operatorname{Aut}\Gamma; W) \xrightarrow{x} H^*(\operatorname{Aut}\Gamma; W[[u_1]])$ Dieudonne modules k perfect field W ring of Witt vectors of k acts on u , $u(x) = x^p W$ acts on u Diuedonne-module: M free W -module of finite rank $F: u^*M \to M$ $F(am) = a^u F(m)$ for an $a \in W$, $V: M \to u^*M V(a^u m) = aUM$, $FU = UF = p$ Formal groups over $k \leftrightarrow$ diedonne modules height \leftrightarrow dim $_M M$ dim \leftrightarrow dim $_M M/VM$ Ex: M basis $\gamma, U\gamma F\gamma = V\gamma$
This $M \leftrightarrow$ height 2 formal group over k $n \neq \{\gamma, V\gamma, \dots, V^{n-1}\gamma\}$ $F\gamma = V^{b-1}\gamma$ Aut Γ , ht $2\gamma \to a\gamma + bV\gamma V\gamma \to a^{b-1}V\gamma + b^{b-1}V^2\gamma = a^{b-1}V\gamma + pb^{b-1}\gamma$ $F\gamma \to a^bV\gamma + pb^b\gamma a$, $b \in W\mathbb{F}_p^2$ $F\gamma = V\gamma p\gamma = VF\gamma = V^2\gamma$ Aut Γ , Γ and Γ and Γ and Γ and Γ and Γ and Γ are Γ and Γ and Γ and Γ are Γ and Γ and Γ are Γ are Γ are Γ and Γ are Γ are Γ are Γ are Γ and Γ are Γ are Γ are Γ and Γ are Γ and Γ are Γ are Γ are Γ are Γ are Γ and Γ are Γ are Γ are Γ are Γ are Γ and Γ are Γ are

lifts of
$$\Gamma$$
 to W .

Dotted map *W*-linear specialization $\gamma \rightarrow 1$?

Bottom map
$$\gamma \mapsto 1$$

$$U_1(T) = T(V\gamma) W[[u_1]]$$

$$\gamma \xrightarrow{y} a\gamma + bV\gamma V\gamma \rightarrow a^{\phi^{-1}}V\gamma + pb^{\phi^{-1}}\gamma y(u_1) = (a^{\phi^{-1}}u_1 + pb^{\phi^{-1}})/(bu_1 + a)$$

Crystalline Approximation

$$M \to E_{-2} = uW[[u_1 \cdots u_{n-1}]]$$

 $\gamma \to u \ V \gamma \to u u_1 \ \vdots \ V^{n-1} \gamma \to u u_{n-1} \ \mathrm{Aut} \ \Gamma \ \mathrm{equivalent}.$

$$G\ k \leftarrow W \rightarrow u \otimes W\ G \cong O_n$$

$$\Gamma$$

$$f(\gamma) = \log_G(x) = x + \dots + u \otimes w[[x]]\ f^{-1}(f(x) + f(y)) = x +_F y$$

$$\text{Ex: } \log_{G_m}(x) = \sum x^n/n$$

$$T: M \rightarrow W\ f(x) = \sum T(F^n\gamma)x^{p^n}/p^n \text{ is the log of a formal? over } W$$

$$\text{Ex: } G = G_m\ M = ?\{\gamma\}\ F\gamma = \gamma$$

$$\log = \sum x^{p^n}/p^n$$

$$\text{Ex: } \text{ht} = 2\ T(\gamma) = 1\ T(v\gamma) = 0\ f(y) = \sum x^{p^{2n}}/p^n = l(x)$$

$$W[[w_1]]\ T(\gamma) = 1\ T(V\gamma) = W_1$$

$$f(x) = l(x) + w_1/pl(x^p)\ f^{-1}(f(y) + f(y)) \text{ does not have coefficients in } ?[[w_1]]$$
 It does have coefficient in the divided power completion $w << w_1 >>$.

Definition. q and q' are in the same genus if they are $\simeq \mod N$ for all N > 0.

If q is a form over \mathbb{Z} and R a commutative ring.

$${A \in GL_n(R) : q \circ A = q} = O_q(R) \supseteq O_q(\mathbb{R}) \supseteq O_q(\mathbb{Z})$$

a compact Lie group of dimension n(n-1)/2.

$$Mass(q) = \sum_{q' \text{of genus } q} \frac{1}{|O_{q'}(\mathbb{Z})|'}$$

where the sum is taken over equivalence classes of quadratic forms.

Definition (Unimodular). *q* is unimodular if nondegenerate mod *p* for all *p*

$$x^2 + y^2 \equiv (x + y)^2 \mod 2.$$

Mass Formula (Unimodular Case):

 $8 \mid n \operatorname{Mass}(q) = \operatorname{something else but}$

$$\operatorname{Mass}(q) = \sum_{q' \text{unimodular}} \frac{1}{|O_q(\mathbb{Z})|} = \frac{\zeta(n/2)\zeta(2)\zeta(4)\cdots\zeta(n-2)}{\operatorname{Vol}(S^1)\operatorname{Vol}(S^2)\cdots\operatorname{Vol}(S^{n-1})}$$

Example 5.1. n = 8

$$RHS = \frac{1}{2^{14} \cdot 3^5 \cdot 5^2 \cdot 7}$$

Then Mass-formula tells you there is a unique unimodular form in 3 variables.

Example 5.2. n = 32 RHS is approximately 40,000,000. Looking at left side, this implies there exists *a lot* of inequivalent unimodular forms in 32 variables.

Let q, q' are in the same genus. $q = q' \circ A_N$ for some $A_n \in GL_n(\mathbb{Z}/N\mathbb{Z})$. WLOG $\{A_N\} = A \in GL_n(\hat{\mathbb{Z}})$ $\hat{\mathbb{Z}} = \text{proj lim } \mathbb{Z}/N\mathbb{Z} = \prod_p \mathbb{Z}_p \ q = q' \circ A \Rightarrow q, q' \text{ are equivalent over } \mathbb{Z}_p \text{ for all } p \text{ Then } q, q' \text{ are equivalent over } \mathbb{Q}_p = \mathbb{Z}[1/p].$

Hasse-Minkowski: Then $q = q' \circ B$, where $B \in GL_n(\mathbb{Q})$ $q = q' \circ A = q \circ B^{-1} \circ A$ $B^{-1} \circ A \in O_q(\mathbb{Q})/O_q(A^{\text{fin}})/O_q(\hat{\mathbb{Z}})$ Want to count size of this.

$$B^{-1} \circ A \in O_q(\mathbb{Q})/O_q(A)/O_q(\hat{\mathbb{Z}} \times \mathbb{R})$$

A has a natural topology that makes it into a locally compact ring containing \mathbb{Q} as a discrete subring. This induces $O_q(A)$, which has the structure of a locally compact group with discrete subgroup $O_q(\mathbb{Q})$ and $O_q(\hat{Z} \times \mathbb{R})$, a compact open subgroup.

$$O_q(\mathbb{Q})/O_q(\mathbb{A})$$
 acted on by $O_q(\hat{\mathbb{Z}} \times \mathbb{R})$

of orbits =
$$\frac{\mu(O_p(\mathbb{Q}) \ O_q(\mathbb{A}))}{\mu(O_q(\hat{\mathbb{Z}} \times \mathbb{R}))}$$

Not quite correct.

 $SO_Q(A)$ has a canonical Haar measure called Tamagawa measure

$$2^{k} \operatorname{Mass}(q) = \frac{\mu(\operatorname{SO}_{q}(\mathbb{Q}) / \operatorname{SO}_{q}(A))}{\mu(\operatorname{SO}_{q}(\hat{\mathbb{Z}} \times \mathbb{R}))}$$

 $SO_q(A) = SO_q(\mathbb{R}) \times \prod_p^{res} SO_q(\mathbb{Q}_p) \ V_{\mathbb{R}}$ is the space of translation invariant topological forms on $SO_q(\mathbb{R})$. $V_{\mathbb{R}} \supseteq V_{\mathbb{Q}}$ the space of translation invariant topological forms on $SO_q(\mathbb{Q})$

 $V_{\mathbb{Q}_p}$ the space of translation invariant topological forms on $SO(\mathbb{Q}_p)$

 $SO_q(\mathbb{Q}_p)$ is a *p*-adic analytic Lie group.

 $0 \neq \omega \in V_{\mathbb{Q}} \mapsto \mu_{\omega,\mathbb{R}}$

 $0 \neq \omega \in V_{\mathbb{Q}} \mapsto \mu_{\omega,\mathbb{Q}_p}$

Tamagawa Measure

$$\mu_{\mathsf{Tam}} = \prod_p \mu_{\omega, \mathbb{Q}_p} imes \mu_{\omega, \mathbb{R}}$$

independent of ω

$$\operatorname{Mass}(q) = 2^{-k} \frac{\mu_{\operatorname{Tam}}(\operatorname{SO}_q(\mathbb{Q}) / \operatorname{SO}_q(\mathbb{R}))}{\mu_{\operatorname{Tam}}(\operatorname{SO}_q(\hat{\mathbb{Z}} \times \mathbb{R}))}$$

 $\mathrm{SO}_q(\hat{\mathbb{Z}} \times \mathbb{R}) = \mathrm{SO}_q(\mathbb{R}) \times \prod_p \mathrm{SO}_q(\mathbb{Z}_p) \ \mu_{\mathrm{Tam}}(\mathrm{SO}_q(\hat{\mathbb{Z}} \times \mathbb{R})) \stackrel{\mathrm{def}}{=} \mu_{\omega,\mathbb{R}}(\mathrm{SO}_q(\mathbb{R})) \times \prod_p \mu_{\omega,\mathbb{Q}_p}(\mathrm{SO}_q(\mathbb{Z}_p))$ Mass Formula (Tamagawa-Weil Version) $\mu_{\mathrm{Tam}}(\mathrm{SO}_q(\mathbb{Q})/\mathrm{SO}_q(\mathbb{A})) = \mathbb{Z} \ \mathrm{SO}_q$ has a two-sheeted double cover Spin_q

Equivalent: $\mu_{\text{Tam}}(\text{Spin}_q(\mathbb{Q})/\text{Spin}_q(A)) = 1$

Conjecture (Weil)

Let G be a simply connected semisimple algebraic group over \mathbb{Q} $\mu_{\text{Tam}}(G(\mathbb{Q})/G(\mathbb{A}))=1$, where $G(\mathbb{Q})$ is τ_G , the Tamagawa number of G.

Now a theorem, proved by Weil in many cases, Langlands when split group, ...,

Lecture 1 6.1

6.1.1 Lecture Name

 $X \to \operatorname{Spec}(\mathbb{F}_q)$, where X smooth projective curve over \mathbb{F}_q , write K_X for the fraction field of X. A field which arrives this way is called a function field.

Function Fields closed points $x \in X k(x)$ field Number Fields $\mathbb Q$ prime numbers p and at $x \mathcal O_x$ complete local ring of X at $\mathcal O_x \cong$ Number Fields Q prime numbers p and at $x \in \mathcal{O}_x$ complete local ring of X at $\mathcal{O}_x \cong P$ point at $x \in \mathbb{Z}/P\mathbb{Z}$ \mathbb{Z}_p Qp or \mathbb{R} A point at $\mathbb{Z}/P\mathbb{Z}$ \mathbb{Z}_p Qp or \mathbb{R} A ple group G_0 over $\dim(G_0 Y K_x)$

 $Bun_G(X)$ the moduli stack of G-bundles

Maps: Spec $R \to \operatorname{Bun}_G(X)$ similar G-bundle on $X \times_{\operatorname{Spec}(\mathbb{F}_a)} \operatorname{Spec} R$

Goal: Compute
$$\sum \frac{1}{|\operatorname{Aut}(S)|} =: |\operatorname{Bun}_G(X)(\mathbb{F}_q)|$$

Digression Y algebraic variety over $\mathbb{F}_q \mid Y(\mathbb{F}_q) \mid$ Idea: $\overline{Y} := Y \times_{\operatorname{Spec} \mathbb{F}_q} \operatorname{Spec}(\overline{F}_q)$ Think of $Y(\mathbb{F}_q) \subseteq$ $\overline{Y} \overline{Y} \xrightarrow{u} \overline{Y}$, where *u* is geometric frobenius

$$\overline{Y} \xrightarrow{u} \overline{Y}$$

$$\mathbb{P}^n \stackrel{u}{\longrightarrow} \mathbb{P}^n$$

$$[x_0:\cdots:x_n],[x_0^q:\cdots:x_n^q]$$

 $Y(\mathbb{F}_q)$ fixed points of u

Ideal (Weil) $|Y(\mathbb{F}_q)|$ should be $\sum (-1)^i \operatorname{Tr}(u \mid H^i(\overline{Y}))$

This is now a theorem of Grothendieck-Lefschetz Formula

Assume Y smooth of dimension d

 $H_i^i(\overline{Y}) \sim H^{2d-i}(\overline{Y})^{\vee}$ poincare duality Not *u*-equivariant

$$\sum (-1)^{i} \operatorname{Tr}(u^{-1} \mid H^{i}(\overline{Y})) = \frac{|Y(\mathbb{F}_{q})|}{q^{?}}$$

Idea apply this to $Y = Bun_G(X)$

Definition. $Y = Bun_G(x)$ satisfies the trace formula if

$$\frac{\sum \frac{1}{|\operatorname{Aut}(P)|}}{q^{\dim\operatorname{Bun}_G(X)} = \sum (-1)^i \frac{\operatorname{Tr}(u^{-1})}{|H^i(\overline{\operatorname{Bun}_G(X)})|} =: \operatorname{Tr}|u^{-1}|H^*(\overline{\operatorname{Bun}_G(X)})$$

Weil's conjecture follows from two assertions

1. Bun_G X satisfies GL
$$\frac{\sum 1/|\operatorname{Aut}(P)|}{/}q^D = \operatorname{Tr}(u^{-1} \mid H^*(\overline{\operatorname{Bun}_G(X)})) = 2\prod_{x \in X} \left(\frac{|G(k(X))|}{|K(x)|^d}\right)^{-1}$$

First equality in 1. shown by theorem of Behrend in case *G* is a constant group, or everywhere semisimple.

Digression:

Let $x \in X$ be closed point. Bun_G($\{x\}$) = BG_x .

 $\operatorname{Bun}_G(\{x\})(\mathbb{F}_a)$ is set of principle *G*-bundles on $\operatorname{Spec}(k(X))$ has one object, namely symmetry group is G(K(x))

$$\frac{|\operatorname{Bun}_{G}(\{x\})(\mathbb{F}_{q})|}{q^{\dim \operatorname{Bun}_{G}(\{x\})}} = \frac{|k(x)|^{d}}{|G(k(x))|}$$

 $Bun_G({x})$ satisfy GL trace formula

$$\frac{|k(x)|^d}{|G(k(x))|} = \operatorname{Tr}(u^{-1} \mid H^*(\overline{\operatorname{Bun}_G(\{x\})}))$$

$$\operatorname{Tr}(u^{-1} \mid H^*(\operatorname{Bun}_G(X))) = \prod_{x \in X} \operatorname{Tr}(u^{-1} \mid H^*(\operatorname{Bun}_G(\{x\}))).$$

$$\operatorname{Bun}_{G}(X) = \prod_{x \in X}^{\operatorname{cont}} \operatorname{Bun}_{G}(\{x\})$$

$$H^{2}(\overline{\operatorname{Bun}_{G}(X)}) = \bigoplus_{x \in X}^{\operatorname{cont}} H^{*}(\operatorname{Bun}_{G}(\{x\})) \text{ Makes sense using theory of factorization homology}$$

$$\prod_{x \in X} \frac{1}{1 - 1/|k(x)|^{2}} |\operatorname{SL}_{2}(\mathbb{F}_{q})| / q^{\dim} = (q^{3} - q) / q^{3} = 1 - 1/q^{2}$$

$$\prod_{x \in X} \frac{1}{1 - 1/|k(x)|^2} |\operatorname{SL}_2(\mathbb{F}_q)| / q^{\dim} = (q^3 - q) / q^3 = 1 - 1/q^3$$

$$\operatorname{Bun}_G(X) = \bigsqcup_{x \in \mathbb{Z}} \operatorname{Bun}_G^?(x)$$

$$Y \to \operatorname{Spec}(\mathbb{F}_q) |Y(\mathbb{F}_q)| = \sum_{y \in Y(\mathbb{F}_q) \text{iso classes}} \frac{1}{|\operatorname{Aut}(y)|}$$

Definition. Y satisfies the G-L trace formula if

$$\frac{|Y(\mathbb{F}_q)|}{q^D} = \operatorname{Tr}(u^{-1} \colon H^*(\overline{Y})) := \operatorname{sum}(-1)^i \operatorname{Tr}(u^{-1} \colon H^1(\overline{Y}))$$

For example, true if *Y* is a variety

Example: *G* linear algebraic group over \mathbb{F}_q Y = BG Spec $R \to Y = BG$ equivalent to principle *G*-bundle on Spec R

Example: $G = \mathbb{G}_m Y = B\mathbb{G}_m Y(\mathbb{F}_q)$ is the category of 1-dimensional vector spaces over $\mathbb{F}_q |Y(\mathbb{F}_q)| = 1/(q-1)$

 $D = \dim B | G_m BG_m = *//G_m \dim BG_m = -1$

$$\frac{|Y(\mathbb{F}_q)|}{q^{\dim Y}} = \frac{q}{q-1}$$

RHS: $\text{Tr}(u^{-1}: H^*(\overline{B\mathbb{G}_m})) \mathbb{G}_m(\mathbb{C}) = \mathbb{C}^* B\mathbb{G}_m$, $B\mathbb{C}^*$, quotient of a contractible space by free action of \mathbb{C}^*

 \mathbb{C}^* acts freely on $V \setminus \{0\}$ V has dimension n $V \setminus \{0\} = S^{2n-1}$

If dim $V = \infty V \setminus \{0\}$ is contractible $B\mathbb{C}^* = (V \setminus \{0\})/\mathbb{C}^* =: \mathbb{CP}^{\infty}$

 $H^*(\mathbb{CP}^\infty; A) \cong \Lambda[t], \deg t = 2$

 $H^*(\overline{B\mathbb{G}_m}) = \mathbb{Q}_{\ell}[t]$, where deg t = 2

 $u(t) = q^t u(t^n) = q^n t^n \operatorname{Tr}(u^{-1}: H^*(B\mathbb{G}_m)) = \sum_{n \ge 0} q^{-n} = q/(q-1)$

Conclusion: G-L is okay for $B\mathbb{G}_m$.

 ℓ -adic homotopy:

 \overline{Y} is an algebraic-geometric object over an algebraically closed field $k = \overline{F}_q \ y \in \overline{Y}(k)$

 $\pi_1^{\rm et}(\overline{Y},y)$ profinite group. Assume \overline{Y} is connected.

Then finite etale covers of \overline{Y} are in correspondence with finite sets with continuous action $\pi_1^{\text{et}}(\overline{Y}, y)$.

 $\pi_1^{\text{et}}(\overline{Y},y)_{\ell}$ the maximal pro- ℓ quotient of $\pi_1^{\text{et}}(\overline{Y},y)$, $\ell \neq 0$ in k

Artin-Mazur (*ℓ*-adic version)

Assume: $\pi_1(\overline{Y}, y)_{\ell} = 0$ if and only if $H^1_{\text{et}}(\overline{Y}, \mathbb{Z}/\ell) = 0$ Also: $H^n_{\text{et}}(\overline{Y}; \mathbb{Z}/\ell)$ finite.

To \overline{Y} , they associate a topological space $Z(\ell)$ -adic homotopy type at y) with

1) Z is simply connected to $\pi_n Z$ is a finitely generated \mathbb{Z}_ℓ -module for all n

2) $H_{\text{sing}}^*(Z; \mathbb{Z}/\ell) \simeq H_{\text{et}}^*(\overline{Y}; \mathbb{Z}/\ell)$

For each n > 0, $\pi_n(\overline{Y}) := \pi_n(Z)$ a finitely generated \mathbb{Z}_ℓ -module

 $\pi_n(\overline{Y})_{\mathbb{Q}_\ell} := \pi_n(\overline{Y})[1/\ell]$ finite dimensional vector space over \mathbb{Q}_p

Have a canonical pairing $b: \pi_n(\overline{Y})_{\mathbb{Q}_\ell} \times H^n(\overline{Y}) \to \mathbb{Q}_\ell$ $f: S^n \to Z$ $b(f, \eta) = f^* \eta \in H^n(S^n; \mathbb{Q}_\ell) \simeq \mathbb{Q}_\ell$ $I = H^*_{\text{red}}(\overline{Y}) = \bigoplus_{n \geq 0} H^n(\overline{Y})$ $b: \pi_*(\overline{Y}) \times I \to \mathbb{Q}_\ell$ descends to a pairing $b: \pi_*(Y)_{\mathbb{Q}_\ell} \times I/I^2 \to \mathbb{Q}_\ell$, $\eta = \eta' \eta'' f^*(\eta) = f^*(\eta') f^*(\eta'')$

Assertion: If $H^*(\overline{Y})$ is polynomial ring (or even generators) then b is a perfect pairing.

$$\cdots \subseteq I^3 \subseteq I^2 \subseteq I \subseteq H^2(\overline{Y})$$

Ex: $\overline{Y} = \overline{BG_m}$, this applies

Suppose $H(\overline{Y})$ is a polynomial ring $\overline{Y} = Y \times_{\operatorname{Spec} \mathbb{F}_q} \operatorname{Spec}(\overline{F}_q)$

 $\operatorname{Tr}(u^{-1}\colon H^*(\overline{Y})) := \sum (-1)^i \operatorname{Tr}(u^{-1}|H^i(\overline{Y})) \ \pi_* \overline{Y}|_{\mathbb{Q}_\ell} \simeq (I/I^2)^\vee$ finite dimensional over \mathbb{Q}_ℓ u has complete eigenvalues $\lambda_1,\ldots,\lambda_n$ on $\pi_*(\overline{Y})_{\mathbb{Q}_\ell}$. u^{-1} has eigenvalues $\lambda_1,\ldots,\lambda_r$ $\operatorname{Tr}(u^{-1}|H^*(\overline{Y})) = \operatorname{Tr}*u^{-1}|\operatorname{gr}(H^*(\overline{Y})) = \operatorname{Tr}(u^{-1}|\operatorname{Sym}^*(I/I^2))$

 $\operatorname{Tr}(u^{-1}|\operatorname{Sym}^*(I/I^2)) = \sum_{e_1,\dots,e_n\geq 0} \lambda_1^{e_1} \lambda_2^{e_2} \cdots \lambda_n^{e_n} = \prod_{i=1}^n 1/(1-\lambda_i)$

 $\operatorname{Tr}(u^{-1}|H^*(\overline{Y})) = (\det(1 - u|(\pi_*\overline{Y})_{\mathbb{Q}_\ell}))^{-1}$

Ex $\overline{Y} = B\mathbb{G}_m$ $(\pi_*\overline{Y})_{\mathbb{Q}_\ell}$ 1-dimensional vector space acted on by $u = 1/q = \det(1-u) = 1-1/q$. Ex: Let G be any connected linear algebraic group over \mathbb{F}_q over \mathbb{F}_q , G-L trace formula for BG.

$$\frac{|BG(\mathbb{F}_q)|}{q^{\dim BG}} = \operatorname{Tr}(u^{-1}|H^*(\overline{BG}))$$

LHS is $q^{\dim G}/|G(\mathbb{F}_q)|$ RHS is $(\det(1-u|\pi_*(\overline{Y})_{\mathbb{O}_\ell})^{-1}$

Steinberg's Formula $|G(\mathbb{F}_q)| = q^{\dim G} \det(1 - u | \pi_*(\overline{BG})_{\mathbb{Q}_\ell})$

Ex: $G = GL_n H^*(\overline{BG}) = \mathbb{Q}_{\ell}[c_1, ..., c_n] \pi_*(\overline{BG})_{\mathbb{Q}_{\ell}} = \mathbb{Q}_{\ell}\{e_1, ..., e_n\} u(c_n) = q^i c_i u(e_i) = q^{-i} e_i$

Steinberg $|\operatorname{GL}_n(\mathbb{F}_q)| = q^{n^2} (1 - 1/q) (1 - 1/q^2) \cdots (1 - 1/q^n)$

In general (not assuming \overline{Y} is polynomial)

There is a spectral sequence $\operatorname{Sym}^*(\pi_*\overline{Y})^\vee_{\mathbb O} \to H^*(\overline{Y})$

Gives some conclusion $\text{Tr}(u^{-1}|H^*(\overline{Y})) = \det(1 - u|\pi_*(\overline{Y}))^{-1} := \prod_i \det(1 - u|\pi_1(\overline{Y}))^{(-1)^2}$ assuming everything converges. [For example, if $\pi_*(\overline{Y})_{\mathbb{Q}_\ell}$ is finite dimensional.]

This will apply when $Y = Bun_G(X)$.

Goal: Classical Hochschild/cyclic homology Topological versions relations to alg/arith geometry Today: Classical Theory Fix commutative base ring k For any k-algebra A have hochschild complex

$$HH(A/k) := A \leftarrow A \otimes_k A \leftarrow A \otimes_k A \otimes_k A$$

given by maps $a_0 \otimes a_1 = a_0 a_1 - a_1 a_0 \ a_0 \otimes a_1 \otimes a_2 \mapsto a_0 a_1 \otimes a_2 - a_0 \otimes a_1 a_2 + a_2 a_0 \otimes a_1$

hochschild homology $HH_n(A/k)$, $n \ge 0$, are homology of HH(A/k).

- 1. $HH_0(A/k) = A/\langle ab ba \rangle = A/[A, A] = A$ (if A is commutative)
- 2. If *A* is commutative then $HH_1(A/k) = A \otimes_k A/\langle ab \otimes c a \otimes bc + ac \otimes b : a, b, c, d \rangle$ (Leibniz ??? $\leftrightarrow a \otimes b$)= $\Omega^1_{A/k}$
 - 3. $HH_*(A/k) = \bigoplus_{n>0} HH(A/k)$ as commutative *k*-algebra (*A*-algebra) *A* commutative
 - 4. 1.-s. then by universal property of $\Omega_{A/k}^* = \Lambda_A^* \Omega_{A/k}^1$

Theorem 10.1 (Hochschild-Kashent-Rosenberg, 60s). *If A is smooth over k, then the maps* $\epsilon_n : \Omega^n_{A/k} \to \Omega^n_{A/k}$ $HH_n(A/k)$ are isomorphisms.

Philosophy (connes, feigir-Tsygs lodey-quillen) think of HH_{*} as generators of diff. forms (even if *A* is noncommutative).

To prove HKR, adopt homological perspective on HH.

Lemma 10.1. For any flat k-algebra A, $HH(A/k) \cong A \otimes_{A \otimes A^{op}} A$.

Proof. Explicit isom. of complexes

$$\operatorname{HH}(A/k) \cong A \otimes_{A \otimes A^{\operatorname{op}}} \underbrace{[A \otimes_k A \leftarrow A \otimes_k \otimes_k A \otimes_k A]}_{\operatorname{Bar \ complex}}$$

Bar complex is resolution of *A* by flat $A \otimes_k A^{op}$ modules.

Corollary 10.1.
$$HH_*(A/k) \cong Tor_*^{A \otimes A^{op}}(A, A)$$

Proof. (HKR thm) A smooth k-algebra must show that $HH_*(A/k)$ is the exterior algebra on its degree 1 elements—this is well known for this graded algebra.

$$Tor_*^B(C,C)$$

when $B \to C$ (surj?) has kernel is locally generated by a regular sequence $A \otimes_k A \to A$ (given $k \to A$ smooth).

Next: cyclic homology. $HH(A/k) = A_{\mathbb{Z}/1} \leftarrow \underbrace{A \otimes_k A}_{\mathbb{Z}/2} \leftarrow \cdots$ where $\mathbb{Z}/n + 1CA^{\otimes n+1}$ generated

$$t_n: a_0 \otimes \cdots_n \mapsto a_n \otimes \cdots \otimes a_{n-1}$$

Set 'norm'
$$N := \sum_{i=0}^{n} (-1)^n t_n : A^{\otimes n+1} \to A^{\otimes n+1}$$

$$t_n: a_0 \otimes \cdots_n \mapsto a_n \otimes \cdots \otimes a_{n-1}$$

Set 'norm' $N:=\sum_{i=0}^n (-1)^n t_n: A^{\otimes n+1} \to A^{\otimes n+1}$
Extra dengenercy: $s: A^{\otimes n} \to A^{\otimes n+1}$ given by $a_0 \otimes a_n \mapsto 1 \otimes a_0 \otimes \cdots \otimes a_n$

Connes operator:
$$S: A^{\otimes n} \xrightarrow{N} A^{\otimes n} \xrightarrow{s} A^{\otimes n+1} \xrightarrow{1-(-1)^n t_n}$$

Check: $\hat{B^2} = 0$, Bb = -bB, where b is the boundary map in HH. 'mixed complex or an algebraic S^1 -complex.

i.e. $B: HH(A/k) \rightarrow HH(A/k)[-1]$

Idea: This refers to de Rham diff. commutative diagram

$$\begin{array}{ccc} \operatorname{HH}_n(A/k) & \stackrel{B}{\longrightarrow} & \operatorname{HH}_{n+1}(A/k) \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & \\ & &$$

Def: hochschild complex

$$A^{\otimes 4} \leftarrow_{B} A^{\otimes 3} \leftarrow_{B} A^{\otimes 2} \leftarrow_{B} A$$

$$\downarrow^{b} \qquad \downarrow^{b} \qquad \downarrow^{b}$$

$$A^{\otimes 3} \leftarrow_{B} A^{\otimes 2} \leftarrow_{B} A$$

$$\downarrow^{b} \qquad \downarrow^{b}$$

$$A^{\otimes 2} \leftarrow_{B} A$$

$$\downarrow^{b}$$

$$A$$

right section $x \ge 0$ while left is ≤ 0

HP(A/K) (periodic cyclic homology) product totalization of this complex

HC(A/k) (cyclic homology) totalization of $x \ge 0$

 $HC^{-}(A/k)$ (negative cyclic homology) totalization of $x \le 0$

$$0 \longrightarrow HH \longrightarrow HC \stackrel{s}{\longrightarrow} HC[2] \longrightarrow 0$$
$$0 \longrightarrow HC^{-}[-2] \stackrel{s}{\longrightarrow} HC^{-} \longrightarrow HH \longrightarrow 0$$

Norm sequence: $0 \longrightarrow HC^- \longrightarrow HP \longrightarrow HC[s] \longrightarrow 0$

$$\operatorname{HP} \cong \operatorname{proj\,lim}(\cdot\operatorname{HC}[-4] \stackrel{s}{\longrightarrow} \operatorname{HC}[-1] \stackrel{3}{\longrightarrow} \operatorname{HC}) \to S: \operatorname{HP} \stackrel{\cong}{\longrightarrow} \operatorname{HP}[z]$$

 $HP_n(A/k) \cong HP_{n+z}(A/k)$.

coarse info about hh gives coarse info about HP, HC⁻, HC

Example: assume $HH_{odd}(A/k) = 0$, e.g. a perfectoidish. Then $HP_0(A/k)$ is a complex filtered ring which ecnodes a lot of the above data. Here precisely $HP_0(A/k)$ is a ring with filtered by ideals

$$\operatorname{Fil}^n \operatorname{HP}_0(A/k) = S^n(\operatorname{HC}_{2n}^-(A/k))$$

such that $HP_0(A/k)/Fil^n \cong HC_{2n-2}(A/k)$ and $gr^h \cong HH_{2n}()$

11.1 Lecture 1

11.1.1 Lecture Name

A brief review

A a k-algebra \rightarrow Hochschild complex

$$HH(A/k) := A \stackrel{k}{\leftarrow} A^{\otimes 2} \stackrel{k}{\leftarrow} A^{\otimes 3} \stackrel{k}{\leftarrow} \cdots$$

 $HH_n(A/k) \leftrightarrow \Omega_{A/k}^n$

Norm sequence: $0 \longrightarrow \mathrm{HC}^-(A/k) \longrightarrow \mathrm{HP}(A/k) \longrightarrow \mathrm{HC}(A/k)[2] \longrightarrow 0$

If $HH_{odd}(A/k)=0$, then also for HC^- , HP, HC and get $0\longrightarrow HC_{2n}^-(A/k)\longrightarrow HP_{2n}(A/k)\longrightarrow HC_{2n-2}(A/k)\to 0$

 $HP_{2n}(A/k) \cong HP_0(A/k)$

 $HP_0(A/k)$ is filtered ring with associated graded = $HH_{2*}(A/k)$

Main theorem about smooth algebras (loday-quillen, Feign-Tsyon, Connes) If A is a smooth k-algebra and $k \supseteq \mathbb{Q}$, then the norm sequence looks like $\prod_{i \in \mathbb{Z}} ?[2i]$, where ? is

$$0 \longrightarrow \Omega_{A/k}^{\geq i} \longrightarrow \Omega_{A/k}^{\cdot} \longrightarrow \Omega_{A/k}^{< i} \longrightarrow 0$$

,i.e. $HP \leftrightarrow de Rham cohomology HC^- \leftrightarrow hodge filtration$

Proof. Explicit map of chain complexes $HH(A/k) \xrightarrow{\delta} [A \leftarrow \Omega^1_{A/k} \leftarrow \Omega^2_{A/k} \leftarrow \cdots] a_0 \otimes \cdots \otimes a_n \mapsto \frac{1}{n!} a_0 da_1 \wedge \cdots \wedge da_n$ on $HH_n(-)$, this splits $\epsilon : \Omega^n \to HH_n$.

Because smooth algebra, maps are isomorphisms. Tells that δ is quism. So looking at double complex, replace up to quism columns by the 'dumb' complex here. Know b operator compatbile with de Rham so looks like sums of direct copies of de rham complexes.

HC etc in characteristic *p*

Thm: R smooth over \mathbb{F}_p . Then the classical theorem is still true but the filtration is not naturally split, e.g. $HP(R/\mathbb{F}_p)$ has a filtration whose graded pieces are $\Omega^i_{R/\mathbb{F}_p}[2i]$, $i \in \mathbb{Z}$.

'classical' proof: yoga if able ??

Today: Analysis if $HP(R/\mathbb{F}_p)$ via perfectish map — will generalize to topological case.

Idea: Don't study smooth algebra but instead quasiregular semiperfect (qrsp) \mathbb{F}_v -algebras

− big (non-noetherian) − but homologically simple

Def: An \mathbb{F}_p -algebra A is qrsp if there exist

a perfect \mathbb{F}_p -algebra B, $B \stackrel{\cong}{\longrightarrow} B$, $b \mapsto b^p$ a regular ideal $I \subseteq B$ I/I^2 is a finite projective B/I-module such that B/I = A.

eg of regular ideal: generated by a regular sequence

Examples: 1) $\mathbb{F}_p[t^{1\bar{l}p^\infty}]/(t)$ 2) if R smooth \mathbb{F}_p -algebra then its perfection $R_{\text{perf}} := \text{inj} \lim R$, where limit over $x \mapsto x^p$ then $R_{\text{perf}} \otimes_R \cdots \otimes_R R_{\text{perf}}$ is qrsp

eg,
$$\mathbb{F}_p[t]_{\mathrm{perf}} \otimes_{\mathbb{F}_p[t]} \mathbb{F}_p[t]_{\mathrm{perf}} \cong \mathbb{F}_p[t^{1/p^{\infty}}] \otimes_{\mathbb{F}_p[t]} \mathbb{F}_p[t^{1/p^{\infty}}] = \mathbb{F}_p[t_1^{1/p^{\infty}}, t_2^{1/p^{\infty}}]/(t_1 - t_2)$$

Technique: form qrsp to smooth all of our homology theories $F = HH(-/\mathbb{F}_p)$, $HC(-/\mathbb{F}_p)$, etc, \mathbb{F}_p -algebra $\to D(\mathbb{F}_p)$

satisfy flat descent, meaning $S \to S'$ is a faithfully flat map of \mathbb{F}_p -algebras. then $F(S) \to \operatorname{Tot}(F(S') \xrightarrow{\rightarrow} F(S' \otimes_S S') \cdots)$

eg, R smooth over \mathbb{F}_p , then $R \to R_{perf}$ is faithfully flat.

So:
$$F(R) \to \text{Tot}(F(R_{\text{perf}})) \to F(R_{\text{perf}} \otimes_R \to R)$$

all are qrsp.

Most understand The other homologies HC^- , HP, HC of any group qrs \mathbb{F}_p ; agebar \mathbb{Q}_p Let A be grsp

Step 1: $HH_{odd}(A/\mathbb{F}_p) = 0$ and $HH_0(A)$ $HH_k = I/I^2I$, where A = B/I $HH_{2n} = \Gamma_A^n(I/I^2)$ nth divided power of I/I^2

 $\cong \operatorname{Sym}_A^n(I/I^2)$ but mult. is twised by ntm m!, n!/(n!m!)

 \to HH_{2*} $(A/\mathbb{F}_p) \cong \Gamma^{A^*}(I/I^2)$ Key words; cotangent complex.

Step 2: $HP_0(A/\mathbb{F}_p)$ is a filtered ring with associated graded $\Gamma_A^*(I/I^2)$ What is it?

ANswer: hcc divided power enveolppe of completed B onto A, regular defin. able $f^n/n!$ to surject to A.

Computation: $HP(R/\mathbb{F}_p)$ (R smooth) is built from copies of

$$\operatorname{Tot}(\operatorname{HP}_0(R_{\operatorname{perf}}/\mathbb{F}_p)) \to \to \operatorname{HP}_0(R_{\operatorname{perf}} \otimes \cdots$$

, where R smooth, contributed by divided power enevelopes ALso show up in theory of derived de Rham cohomolology (Bhatt) so tot is $\cong \Omega^{\cdot}_{R/\mathbb{F}_{\parallel}}$

From HH to Topological HH (HH over the sphere spectrum).

Categorify HH to adapt higher order point of view

$$A \leftarrow \rightarrow A^{\otimes 2}$$

Def: A cyclic object in a category \mathcal{C} is a simplicial object X in \mathcal{C} , i.e. $X:\Delta^{\mathrm{op}}\to\mathcal{C}$ such that each $X_n\in\mathcal{C}$ has action by Z/n+1 plus some axioms.

Eg, HH(A/k) is cyclic object m k-algebras (has universal property)

Conner's cyclic cateogry: there exists $\Lambda \supseteq \Delta$ such that

Objects $\Lambda = \text{ob } \Delta = \{[n]: n \geq 0\}$ Aut_{Λ} $([n]) = \mathbb{Z}/n + 1$ cyclic objects in $\mathcal{C} \leftrightarrow \text{functors } \Lambda^{\text{op}}\mathcal{C}$

The circle appears

Recall cat *E* then topological space |N(E)|

Fact: $|N(\Lambda)| = BS^1$ is the classifying space for the circle S^1 .

Consequences: Any cyclic object X in k-modules give rise to a "object of D(k) with S^1 -action"

 $\underline{X}: BS^1 \to D(k)$ simplicial set, alg/co-cat

Aside: cf, G, a finite group A functor \underline{Y} : $BG \to D(k)$ is a data of $* \mapsto$ some complex $Y \in D(k)$ $g \in G \mapsto gGY$ ie an action of G on Y, i.e. Y is a k[G]-module

Group cohom: $Y^{hG} := Rham_{k[G]}(k, Y) = \lim_{BG} \underline{Y}$

Group homol: $Y_{hG} := Y \otimes_{k[G]}^{\mathcal{L}} k = \operatorname{colim}_{BG} \underline{Y}$

Tate cohom $Y^{tG} := \underbrace{hofib}_{cone} (Y_{gH} \xrightarrow{Homo?,g} Y^{hG})$

Back to S^1 , $\underline{X}:BS^1\to D(k)$ is the data of

Chain complex $\in D(k)$, Dold-Kan of X Module structure over $k[S^1]$. $k[S^1] := k[B\mathbb{Z}] \simeq k[\epsilon]/\epsilon^2$ where ϵ is in homological degree 1.

i.e. $\epsilon = B: X \to X[-1]$ Mimic earlier definitions $x^{hS^1} := Rham_{k[S^1]}(k, X) = \lim_{BS^1} \underline{X}$

 $X_{hS^1} := k \otimes_{k[S^1]} X = \operatorname{colim}_{BS^1} \underline{X} \ X^{tS^1} := hopfib(X_{hS^1}[1] \to norm X^{hS^1} \in D(k)$

If X = HH(A/k) then $HH(A/k)^{hS^1} \simeq HC^-(A/k)$ $HH(A/k)_{hS^1} \simeq HC(A/k)$ $HH(A/k)^{tS^1} \simeq HP(A/k)$

May now replace $A \in k$ -algebra $\subseteq D(k)$ by any rich enough symmetric monodial derived/ ∞ -category eg spectral sp.

 $D(k) \to \text{restriction along } S \to k \ Sp = D(S)$, symmetric monodial, stable ∞ -category unit = S Symmetric monodial stable ∞ -category unit = S

Aalg. \rightarrow A Alg

then cyclic object $HH(A/S) =: THH(A) \in SP$ topological HH.

 $THH(A)^{hS^1} =: TC^-(A)$ negative top cycl hom $THH(A)_{hS^1} \neq: top$ cyclic hom $THH(A)^{tS^1} =: TP(A)$ period top. cyclic hom

 $\in Sp$

 $THH_n(A)$, $TC_n^-(A)$, $\pi_n(THH(A)_{hS^1})$

homotopy groups A-modules \mathbb{Z} -modules $\operatorname{TP}_n(A)$

Comparison with HH

 $THH_n(A) \to HH_n(A)$

Kernel and cokernel killed by some N = N(n)

If $A \supseteq \mathbb{Q}$, then it is an isomorphism.

13.1.1 Lecture Name

A k-algebra $(D(k), \otimes_k) \in \operatorname{HH}(A/k) \subseteq (D(\mathbb{Z}), \otimes_{\mathbb{Z}}) \in \operatorname{HH}(A/\mathbb{Z})$, the last of which is 'nicer'. $(D(k), \otimes_k) \in \operatorname{HH}(A/k) = \operatorname{HH}(A/\mathbb{Z}) \otimes_{\operatorname{HH}(k/\mathbb{Z})} k$

Let us check this. Left side built from $A \otimes_k \cdots \otimes_k A$ RHS built out of $(A \otimes_k \cdots \otimes_{\mathbb{Z}} A) \otimes_{k \otimes_{\mathbb{Z}} \cdots \otimes_{\mathbb{Z}} k} k$ have map from bottom to top

 $(?, \otimes_?) \supseteq (D(\mathbb{Z}), \otimes_{\mathbb{Z}}) \in HH(A/\mathbb{Z})$ symmetric monodial \otimes limits/cochains \cdots dg category (or simplicial \otimes -category.)

No! We cannot do better than $D(\mathbb{Z})$.

Yes but it is simplicial Spa or spectra D(S).

 \mathbb{F}_p , $HP_0(\mathbb{F}_p/\mathbb{F}_p) = \mathbb{F}_p HP_0(\mathbb{F}_p/\mathbb{Z}) = \mathbb{Z}_p \otimes \text{junk}$.

Today: THH= HH(-/S) etc of \mathbb{F}_p -algebras

Thm: Bökshadt THH(\mathbb{F}_p) = 0 and THH_{2×}(\mathbb{F}_p) = $\mathbb{F}_p[u]$, where $u \in \text{THH}_2(\mathbb{F}_p)$

Consequence: For any \mathbb{F}_p -algebra A, get $THH(A)[2] \xrightarrow{u} THH(A) \to HH(A/\mathbb{F}_p) = THH(A) \otimes_{THH(\mathbb{F}_p)} \mathbb{F}_p$, Bökstadt

Then take homotopy $THH_0(A) \cong HH_0(A/\mathbb{F}_p) = A \ THH_1(A) \cong HH_1(A/\mathbb{F}_p) = \Omega_{A/\mathbb{F}_p}$

$$\longrightarrow \mathsf{THH}_1 = \Omega_1 \longrightarrow \mathsf{THH}_2 \longrightarrow \mathsf{HH}_2 \longrightarrow \mathsf{THH}(A) = A \longrightarrow \mathsf{THH}_2(A) \longrightarrow \mathsf{HH}_2(A/\mathbb{F}_p) \longrightarrow 0$$

thm: Hoschild HKR thm): If A is a smooth \mathbb{F}_p -algebra, then $\mathrm{THH}_*(A) \cong \Omega^*_{A/\mathbb{F}_p}$

Enumerative Geometry: counts algebraic-geometric objects satisfying conditions over C

Goal: To record information about fields of definition

Arithmetic count of the lines on a smooth cubic surface

Definition. Cubic surface is $\{(x,y,z): f(x,y,z)=0\}$, where f is degree 3

Better:
$$X \subseteq \mathbb{P}^3 = \{[w, x, y, z]\}, [w, x, y, z] = [\lambda w, \lambda x, \lambda y, \lambda z], \text{ where } \lambda \in K^{\times} X = \{[w, x, y, z] : f(w, x, y, z) = 0\}$$

Theorem 15.1 (Salmon, Cayley 1849). *Let X be a smooth, cubic surface over* C. *Then X contains exactly 27 lines.*

Example 15.1. Fermat
$$f(w,x,y,z) = w^3 + x^3 + y^3 + z^3$$
 $L = \{[S,-S,T,-T] \colon [S,T] \in \mathbb{P}^1\} \ \lambda,\omega : \lambda^3 = \omega^3 = -1$

Lines $\{[S, \lambda S, T, \omega T] : S, T \in \mathbb{P}^1\}$ This produces $3 \cdot 3 \cdot 3 = 27$ llines

Modern proof: Gr(1,3), the Grassmannian parametrizing lines in \mathbb{P}^3 , equivalently $W \subseteq \mathbb{C}^4$, dim W = 2

Let $S \to Gr(1,3)$ be the tautological bundle, $S_W = W \operatorname{Sym}^3 S^* \to Gr(1,3) \operatorname{Sym}^3 S_W^*$ is the cubic polynomial on W, i.e. $\operatorname{Sym}^3 W^* F$ determines element $\operatorname{Sym}^3(\mathbb{C}^4)^*$ then f determines a section of $\operatorname{Sym}^3 S^*$ by $\sigma_f(W) = f|_W$

Note: the line PW corresponding to W is in $X \Leftrightarrow \sigma_f(W) = 0$.

Want: to count zeros of σ_f Euler class: $V \to M$ be a rank r \mathbb{R} -vector bundle on a dimension r \mathbb{R} -manifold M. Assume V is oriented

Choose a section σ with only isolated zeros. $\deg[S^{r-1}, S^{r-1}] \to \mathbb{Z}$, homotopy classes of maps $P \in M$, $\sigma(p) = 0$ To define: $\deg_n \sigma \in \mathbb{Z}$

Here's how: choose local coordinates on M around p. There's a small ball around p with no other zeros. Choose local trivialization of V. Then σ can be identified with a function $\sigma: \mathbb{R}^r \to \mathbb{R}^r$ given by $0 \mapsto 0$, $\sigma(\overline{B_0(1)} = 0) \subset \mathbb{R}^r = 0$ $S^{r-1} = OB_0(1) \xrightarrow{\overline{\sigma}} \partial B_0(1) = S^{r-1}$ given by $x \mapsto \sigma(x)/|\sigma(x)|$

Then $\deg_v \sigma = \deg(\overline{\sigma})$

Euler class $e(V) = \sum_{p:\sigma(p)=0} \deg_p \sigma$

Fact: X smooth then $\deg_p \sigma = 1$, then number of lines on $X = e(\operatorname{Sym}^3 S^*)$. In particular, number of lines is independent of X $e(\operatorname{Sym}^3 S^*) = 27$

Question: What about cubic surfaces over \mathbb{R} ?

Segre in 20th century showed *X* can have 3, 7, 15, or 27 real lines.

Segre 1942 distinguished between different hyperbolic and elliptic real lines on X

Recall:
$$L$$
 real line, $L \cong \mathbb{P}^1_{\mathbb{R}}$, $\operatorname{Aut}(L) \cong \mathbb{P}\operatorname{GL}_2(\mathbb{R}) I \leftrightarrow I = \begin{pmatrix} a & b \\ c & d \end{pmatrix} z \mapsto \frac{az+b}{cz+d} \operatorname{Fix}(I) = \frac{az+b}{cz+d} \operatorname{Fix}(I)$

 $\{z: cz^2 + (d-a)z + b = 0\}$ either consists of 3 real points if and only if *I* hyperbolic. a ?? conjugate pair of points elliptic.

We associate an involution I to $L \subset X$ a real line on a real cubic surface.

$$p \in L$$
 $T_pX \cap X = L \cup Q$ $Q \cap L = points$ q such that $T_qX = T_pX = \{p, p'\}$ $I(p) = p'$

Definition. *L* is elliptic/hyperbolic when *I* is

Alternatively, spin structure.

Example 15.2. Fermat cubic surface $x^3 + y^3 + z^3 = -1$ hyperbolic

Theorem 15.2 (Segre, Okonek, Teleman,...). *Number of hyperbolic lines* - *number of elliptic lines* = 3.

A¹-homotopy theory (due to Morel-Voemsky)

On smooth schemes over k, k a field. Morel deg: $[\mathbb{P}^n/\mathbb{P}^{n-1}, \mathbb{P}^n/\mathbb{P}^{n-1}] \to GW(k)$ where GW(k) is the Grothendieck-Witt=group completion of semiring \oplus , \otimes isomorphism classes of (nondegenerate symmetric) bilinear forms $B: V \times V$, finite dimensional k vector spaces

presentation: generators: $\langle a \rangle$, $a \in k^{\times} \langle a \rangle$: $k \times k \to k$, $(x,y) \mapsto axy$ relations: $\langle ab^2 \rangle = \langle a \rangle$, $b \in k^{\times} \langle a \rangle + \langle b \rangle = \langle a + b \rangle = \langle ab(a + b) \rangle$

Example 15.3. $GW(\mathbb{C}) \cong \mathbb{Z}$, rank, $B \mapsto \dim V$

Example 15.4. $GW(\mathbb{R}) \to \mathbb{Z} \times \mathbb{Z}$ by signatures \times rank. Also iso to $\mathbb{Z} \times \mathbb{Z}$ $GW(\mathbb{F}_q) \to \mathbb{F}_q^{\times}/(\mathbb{F}_q^{\times})^2$ given by signatures \times rank, isomorphism

There is an Euler class

$$e(V) = \sum_{p:\sigma(p)=0} \deg_p \sigma$$

R field char not 2. X a smooth cubic surface over k line $L \subseteq X$ is a closed point of Gr(1,3) $L = \{[a,b,c,d]S + [a',b',c',d']T \colon [S,T] \in \mathbb{P}^1\}$ k(L) = k(a,b,c,d,a',b',c',d') $\mathbb{P}^1_{k(L)} \cong L \subseteq X_{k(L)} \subseteq \mathbb{P}^3_{k(L)}$ Given a line L on X, obtain involution $I \in Aut(L) \cong \mathbb{P} GL_2 k(L)$ Fix(I) is either 2k(L) points or a conjugate pair of points in $k(L)[\sqrt{D}]$ for $D \in k(L)^*/(k(L)^*)^2$

Definition. Type(L) := $\langle D \rangle \in GW(k(L))$

Equivalent to
$$D=ab-cd$$
, $I=\begin{pmatrix} a & b \\ c & d \end{pmatrix}$ Type $(L)=\langle -1 \rangle \deg I$

Theorem 15.3 (Kass-W.). *char* $R \neq 2$, X *smooth cubic surface*

$$\sum_{\mathit{linesLofX}} \mathrm{Tr}_{k(l)/k} \, \mathrm{Type}(L) = 15 \langle 1 \rangle + 12 \langle -1 \rangle$$

$$\operatorname{Tr}_{k(L)/k}: GW(k(L)) \to GW(k) \text{ given by } (B: V \times V \to k(L)) \mapsto V \times V \stackrel{B}{\longrightarrow} k(L) \to k$$

 $R = \mathbb{C}$, apply rank, number of lines is $27 k = \mathbb{R}$ apply signature Number of hyperbolic lines – number elliptic lines = 3

Corollary 15.1. $k = \mathbb{F}_q$ Number of elliptic lines L with $k(L) = \mathbb{F}_{q^{2n+1}}$ plus number of hyperbolic lines with $k(L) = \mathbb{F}_{q^{2n+1}}$ is equivalent to 0.

User's guide to \mathbb{A}^1 -homotopy theory

Want: $\mathbb{P}^n/\mathbb{P}^{n-1}$, colimit

Ex:

Ex: Open sets U, V

$$U \cap V \longrightarrow U$$

$$\downarrow$$

$$V \longrightarrow U \cup V$$

Want to glue, crash schemes like topological spaces

treat smooth schemes like manifolds construction of \mathbb{A}^1 -homotopy theory (Morel-Voensky)

 $\operatorname{Sm}_R = \operatorname{smooth} \operatorname{schemes}/k \operatorname{Sm}_k \to \operatorname{Func}(\operatorname{Sm}_k^{\operatorname{op}}, \operatorname{sset}) Y \mapsto \operatorname{Mor}(-, Y)$

Homotopy theory can mean: simplical model category or ∞-category $Pre(Sm_k) = Func(Sm_k^{op}, sset)$ freely adding relations

Problem: had colimits from 2 in Sm_k

Fix: force certain classes of maps to be weak equivalences. Bousfield localization

For an open cover $B = \sqcup_k U_k \to X$ force $\cos k_x \sqcup_x U_x \xrightarrow{\sim} X \operatorname{Pre}(\operatorname{Sm}_k) \xrightarrow{L\tau} \operatorname{Sh}_R$, τ a Grothendieck topology.

(more open sets left to right) Choices: Zariski topology, Niesnevich, étale topology

Def: $f: X \to Y$ (not necessarily smooth, Sm_k) is etale at x if $T_x X \xrightarrow{\sim} T_{f(x)} Y$

Def: $U = \sqcup_x U_x \to X$ is an etale cover if it is etale and surjective

Def: $U = \sqcup_x U_x$ is a Nisnevich cover if it is an etale cover and for every $x \in X$ there exists $u \in U$ such that $u \mapsto x$, $k(x) \stackrel{\sim}{\longrightarrow} k(u)$

Nice properties: $Z \hookrightarrow X$ in Sm_k can often be viewed as $\mathbb{A}^d \to \mathbb{A}^n$

 $\operatorname{Sm}_k \longrightarrow \operatorname{PSh}_k = \operatorname{Func}(\operatorname{Sm}_l^{\operatorname{op}},\operatorname{sset}) \xrightarrow{L_?} \operatorname{Sh}_k \xrightarrow{L_?} \operatorname{Spc}_k$ where last arrow force $X \times \mathbb{A}^1 \xrightarrow{\sim} X$ Spc_k is \mathbb{A}^1 -homotopy theory.

Spheres:

Def: Given pointed spaces $X, Y X \wedge Y := (X \times Y)/(X * *U * *Y)$

Ex: $S^n \wedge S^m = S^{n+m}$

Spheres: S^1 , $\mathbb{G}_m = \mathbb{A}^1 \setminus \{0\}$ $S^{p+q\alpha} = S^{p+q,q} = (S^1)^{\wedge p} \wedge (\mathbb{G}_m)^?$ Ex:

$$G_m \longrightarrow \mathbb{A}^1 \simeq *$$

$$\downarrow \qquad \qquad \downarrow$$

$$\mathbb{A}^1 \simeq * \longrightarrow \mathbb{P}^1$$

then
$$\mathbb{P}^1 \simeq \Sigma \mathbb{G}_m = S^1 \wedge \mathbb{G}_m$$

Ex: $\mathbb{A}^n \setminus \{0\} \simeq (S^1)^{\wedge n-1} \wedge (\mathbb{G}_m)^{\wedge n}$ induction and

$$(\mathbb{A}^{n-1} \setminus \{0\}) \times (\mathbb{A}^{n-1} \setminus \{0\}) \longrightarrow (\mathbb{A}^{n-1} \setminus \{0\}) \times \mathbb{A}^{n}$$

$$\downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow$$

$$\mathbb{A}^{n} \times \mathbb{A}^{1} \setminus \{0\} \longrightarrow \mathbb{A}^{1} \setminus \{0\}$$

$$X \times Y \longrightarrow X$$

$$\downarrow \qquad \qquad \downarrow$$

$$Y \longrightarrow \Sigma X \wedge Y$$

 $\text{Ex: } \mathbb{P}^n/\mathbb{P}^{n-1} \, \simeq \, (S^1)^{\wedge n} (\mathbb{G}_m)^{\wedge n} \, \mathbb{P}^n/\mathbb{P}^{n-1} \, \simeq \, \mathbb{P}^n/\mathbb{P}^h \setminus \{0\} \, \simeq \, \mathbb{A}^n/\mathbb{A}^n \setminus \{0\} \, \simeq \, */\mathbb{A}^n \setminus \{0\} \,$ $\Sigma(\mathbb{A}^n\setminus\{0\}).$

Thom Space: Let $V \to X$ algebraic vector space $\operatorname{Th}(V) = V/V - X \simeq \mathbb{P}(V \oplus \mathcal{O})/\mathbb{P}(V)$ $S \in \operatorname{sset} S \in \operatorname{Pre}(\operatorname{Sm}_k) = \operatorname{Func}(\operatorname{Sm}_k^{\operatorname{op}} \operatorname{sset})$

Purity Theorem: $Z \hookrightarrow X$ closed immersion in $Sm_k X/X - Z \simeq Th(N_Z X)$

Ex: Spec $k \hookrightarrow X$, where X is a smooth scheme U open neighborhood of $z U/U - z \simeq \mathbb{P}_{k(x)}^n/\mathbb{P}_{k(x)}^{n-1} \simeq$ $\mathbb{P}^n/\mathbb{P}^{h-1} \wedge (\operatorname{Spec} k(z)+)$

Compare: z point on manifold, U small ball around $z \Sigma \partial U \simeq U/U - z$

 $GW(k), k_*^m(k)$:

GW(k) is group completion of isomorphism classes of symmetric, nondegenerate bilinear forms over k, \otimes gives ring structure

Generators: $\langle a \rangle$, $a \in k^* \langle a \rangle$: $k \times k \to k$ given by $(x, y) \mapsto axy$ relations: $\langle a, b^* \rangle = a \langle a \rangle \langle b \rangle = \langle ab \rangle$ $\langle a \rangle + \langle b \rangle = \langle a + b \rangle + \langle ab(a + b) \rangle$

then $h := \langle 1 \rangle + \langle -1 \rangle = \langle a \rangle + \langle -a \rangle$ for all a.

Acted on by hyperbolic forms

rank: $GW(k) \rightarrow \mathbb{Z}$ given by $B: V \times V \rightarrow k \mapsto \dim V$

Fundamental ideal: $I := \ker \operatorname{rank}$

 $GW(k) \supseteq I \supseteq I^2 \supseteq \cdots K_i^M = \bigoplus_{i=0}^{\infty} \bigotimes_{j=1}^i k^* / \langle a \otimes (1-a) \rangle$, Milnor K-theory groups

Milnor conjecture, theorem of Voedosky $1 \to \mathbb{Z}/? \to k^* \to k^* \to 1 \ k^* \to H^1_{\text{\'et}}(k,/\mathbb{Z}/?)$ $I^n/I^{n+1} \stackrel{\sim}{\leftarrow} K_n^M(k) \stackrel{\sim}{\longrightarrow} H_{\text{\'et}}^n(k,\mathbb{Z}/?)$ with left map $a_0 \otimes \cdots \otimes a_n \mapsto (\langle 1 \rangle - \langle a_1 \rangle) \cdots (\langle 1 \rangle - \langle a_n \rangle)$ view maps $I^n \to I^n/I^{n+1}$ as invariants on GW(k) n=0 rank n=1 discriminant n=2

hasse-witt invariant

 $B: V \times V \to k \operatorname{disc} B = \det(B(v_i, v_j)) \{v_1, \dots, v_n\}$ is a basis n = 3 Arason invariant $K_*^{MW}(k)$ Milnor-Witt k-theory (hopkins-morel)

Generators: [a] $a \in k^* \deg 1, \deg -1 \eta$

relations: $\eta[a] = [a]\eta[a][1-a] = 0$ (Steinberg relation) $[ab] = [a] + [b] + \eta[a][b]\eta h = 0$

 $GW(k) \cong K_0^{MW}(k) \langle a \rangle \mapsto 1 + \eta[a] \ h = \langle 1 \rangle + \langle -1 \rangle \mapsto h = 2 + \eta[-1]$

Degrees Theorem (Morel) $n \ge 2$

 $[(S^1)^{\wedge n} \wedge \mathbb{G}_m^{\wedge j}, (S^1)^{\wedge n} \wedge \mathbb{G}_m^{\wedge ?}] \cong K_{r-j}^{MW} \text{ eg } [\mathbb{P}^n/\mathbb{P}^{n-1}, \mathbb{P}^n/\mathbb{P}^{n-1}] \cong \mathrm{GW}(k), j=r=n \ R=\mathbb{R}$

$$\begin{bmatrix} S^{2n}, S^{2n} \end{bmatrix} \xleftarrow{G-pts} \begin{bmatrix} \mathbb{P}^n / \mathbb{P}^{n-1}, \mathbb{P}^n / \mathbb{P}^{n-1} \end{bmatrix} \xrightarrow{R-pts} \begin{bmatrix} S^n, S^n \end{bmatrix}$$

Sheaves: K_*^{MW} , GW GW (Spec $L \to Spec L$) = restruction $\mathcal{O}_K L$ or bilinear forms

Transfers: $K \subseteq L$ finite extension of finite schemes over R

 $\operatorname{Tr}_{L/K}: GW(L) \to GW(K)$

geometric transfer, cohomological transfer, absolute transfer depends on generators, does not,

twisted $\operatorname{Tr}_{L/K}(B:V\times V\to L)=V\times V\stackrel{B}{\longrightarrow} \to L\stackrel{\operatorname{Tr}_{L/K}}{\longrightarrow} K$ when $K\subseteq L$ is separable.

geometric: $L = k[z]/\langle f \rangle$

Spec $L \stackrel{z}{\hookrightarrow} \mathbb{P}^1_k \, \mathbb{P}^1_k \to \mathbb{P}^1_k / \mathbb{P}^1 \setminus \{z\}$ is a map $\operatorname{Tr}^{\operatorname{geo}}_{L/K} GW(L) \to GW(K)$

CH: Chow groups $X \in Sm_k$

 $X^{(i)}$ is codimension *i* reduced, irreducible subschemes of X

 $CH^{i}(X) = \bigoplus_{X(i)} \mathbb{Z}/rational$ equivalence

$$V \subset X \times \mathbb{P}^1 \stackrel{N}{V} \wedge (X \times \{0\}) \sim V \wedge (X \times \{1\})$$

useful in enumerative geometry: chern classes, pushforward pullbacks, ring structure Bloch $CH^i *X (= H^i(X, K_i^M)$

Oriented Chow groups or Chow-Witt group

 $\tilde{\mathrm{CH}}^i(X) = H^i(X, K_i^{MW})$ elements are formal rank $Z \in X^{(i)}$ and

Barge-Morel

Computed by Rost-Schmidt complex

$$\bigoplus_{z \in X^{(i+1)}} K_1^{MV}(k(x), \det) \rightarrow \bigoplus_{z \in X^i} GW(k(z), \det_{k(z)} T_z X) \rightarrow \bigoplus_{z \in X^{(i+1)}} K_{-1}^{MW}(k(z), \det)$$

Fasel, M. Levine: pullbacks $f: X \to Y$ pushforward, non-commutative ring structure

E field, Λ 1-dimensional E vector space $K_i^{MW}(E,\Lambda) = K_i^{MW}(E) \otimes \mathbb{Z} \mathbb{Z}[E] \operatorname{CH}^i(X,L) = H^i(X,K_i^{MW}(i))$

 $L \to X$ line bundle $f: X \to Y$ proper $\dim Y - \dim X = r f_* \tilde{\operatorname{CH}}(X, \omega_{X/Z} \otimes f^* y) \det TX$

$$\rightarrow \tilde{CH}^{i-r}(Y, w_{Y/Z}BX)$$

Degree via local degree

Algebraic topology

$$f: S^n \to S^n$$
 $p \in S \deg f = \sum \deg_q f f^{-1}(p) = \{q_1, \dots, q_n\}$

Differential topology formula for $\deg_{x_i} f$ choose coordinates x_1, \ldots, x_n near $q_i y_1, \ldots, y_n$ near P $f: \mathbb{R}^n \to \mathbb{R}^n$

$$\operatorname{Jac} f = \operatorname{deg} \tfrac{\partial f_i}{\partial x_i}$$

$$\deg_{q_i} f = \begin{cases} 1, & \text{if } \operatorname{Jac} f > 0 \\ -1, & \text{if } \operatorname{Jac} f < 0 \end{cases}$$

A¹-alg topology

Lanes/Morel:
$$f: \mathbb{P}^1 \to \mathbb{P}^1/k$$
 $p \in \mathbb{P}^1(k)$ $f^{-1}(p) = \{q_1, \dots, q_n\}$ deg $f = \sum (\operatorname{Jac}_{a_i} f) \in GW(k)$

this does not depend on P

Prop: (Global degree is a sum of local degrees)

$$f: \mathbb{P}^n \to \mathbb{P}^n \text{ finite } f^{-1}(\mathbb{A}^n) = \mathbb{A}^n \, \mathbb{P}^n / \mathbb{P}^{n-1} \xrightarrow{\overline{f}} \mathbb{P}^n / \mathbb{P}^{n-1}$$
$$\deg \overline{f} = \sum_{q \in f^{-1}(p)} \deg_q^{\mathbb{A}^1} f \ p \in \mathbb{A}^n(k)$$

where $\deg_q^{\mathbb{A}^1} f$ is degree of composite

```
\mathbb{P}^n/\mathbb{P}^{n-1} \cong U/U - q \to \mathbb{A}^n/\mathbb{A}^n - p \cong \mathbb{P}^n/\mathbb{P}^{n-1}
